

Volunteer

This diagram shows a volunteer going through our hurricane relief app. They sign in, look at the open relief requests, pick one and claim it, update it to say they're on the way, then mark it done once they've helped. Everything the volunteer does goes through the ReliefSystemFacade, so that's the only object they ever talk to directly. Behind it, the facade is the one calling out to UserManagement to check the login, ReliefManagement to pull up the requests, ReliefRequest to change the status, and DataWriter to actually save it. Solid arrows are method calls, dashed arrows are what gets returned, and the little loop back arrows are just an object updating its own status.
